# 1. Main window

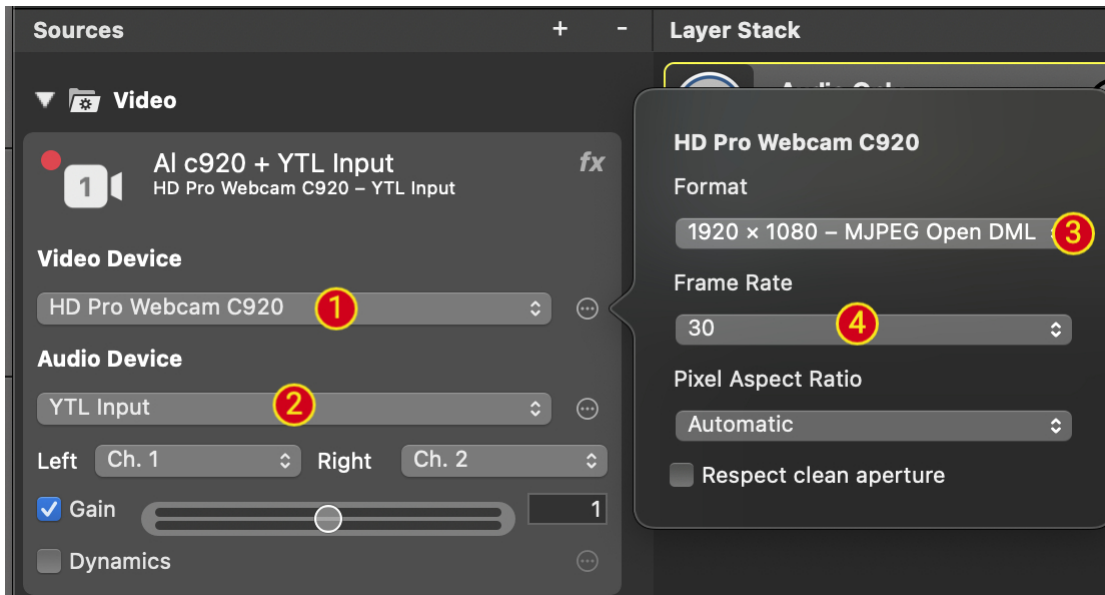

Steve isn't broadcasting here, but everything esles is live

## 2. Video Source - AI c920 + YTL input source

1. Video set to AI's Logitech camera
2. Audio set to YTL Input
  - a. YTL Input is a virtual source created by Loopback, and is a combination of AI's mic + Hindenburg.
  - b. AI's mic is a virtual source that is essentially AI's mic but sweetened
3. Format 1920x1080
4. Frame Rate 30fps

**This is how Steve hears AI + Hindenburg!**

### 3. Video Source - Steve's Audio

I know it makes no sense for this to be a video source, but work with me here.

1. No Video Device
2. Audio Device
  - a. Greyed out here because Steve isn't active but it will be this NDI source mimoLive creates on his end
3. The left channel will say 1 when he's active.

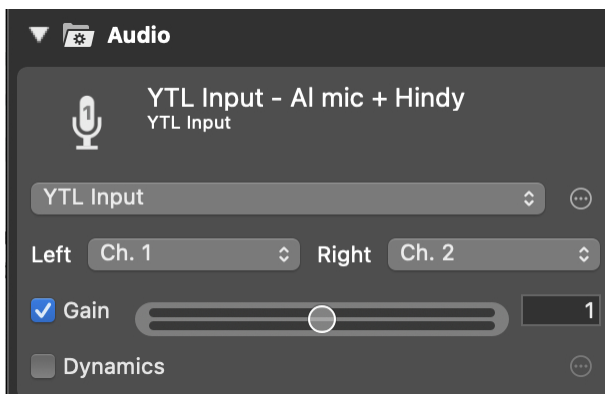

**If AI can't hear Steve, toggling the left channel from 1 to 2 and back sometimes fixes it.**

### 4. Audio Source - YTL Input

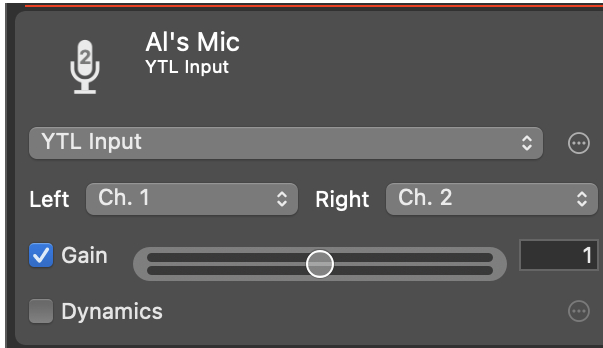

Not entirely sure what function this provides. The Video source entitled AI c920 + YTL Input is what actually let's Steve hear and see Allison.

Might be vestigial?

## 5. Audio Source - Al's Mic

Al's Mic is created by Loopback and is Allison's Heil PR40 into Shure MVl and processed

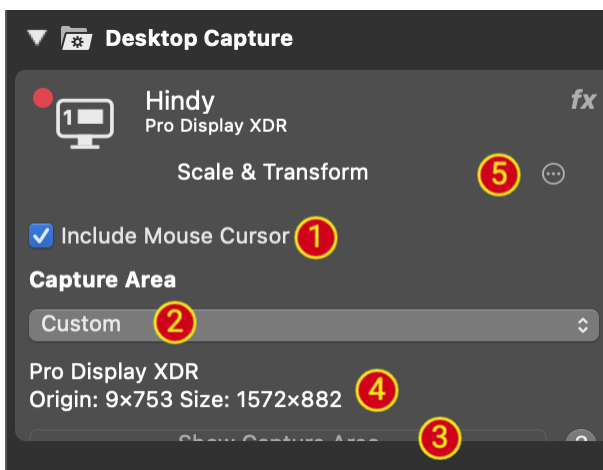

## 6. Desktop Capture Source - Hindy

This creates an NDI source of the portion of the screen where Al keeps Hindenburg. It allows Steve to broadcast video of Hindenburg

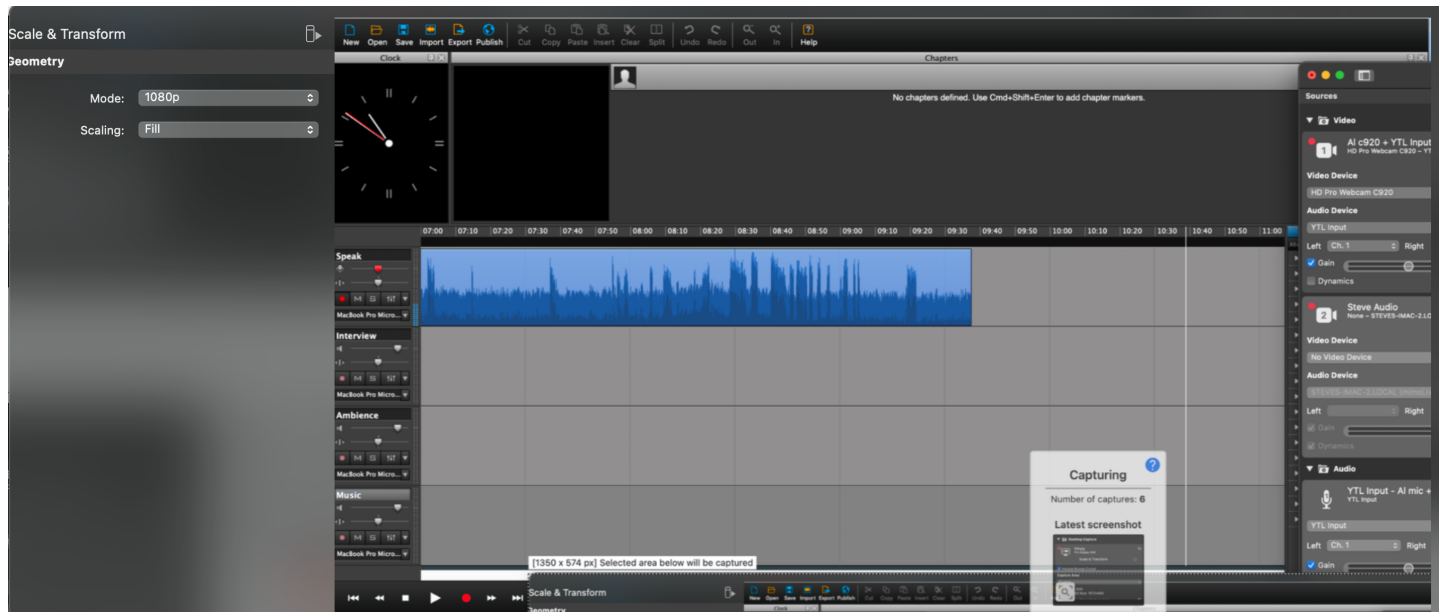

Goal is to have Hindenburg as big as possible on Al's screen, allow Steve to receive something close to 1080p in a 16x9 aspect ratio.

1. Include Mouse Cursor
2. Custom (because I can't quite fit a 1080p version on screen)
3. Using Show Capture Area, drag to size near 1572x882 (sort of arbitrary but it's a ratio of 1.78)
  - a. Note button is partially hidden, temporary graphics glitch in Big Sur
4. Shows area being captured
5. In order to make the size right for Steve AND the frame rate correct AND allow me to broadcast without the red warning about destination problems, we added a scale and transform (see next step)

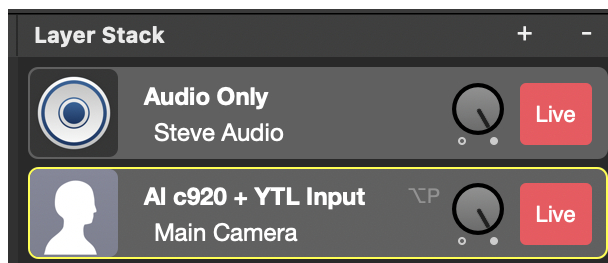

## 6.1 Desktop Capture - Scale and Transform

Set Mode to 1080p and Scaling to fill.

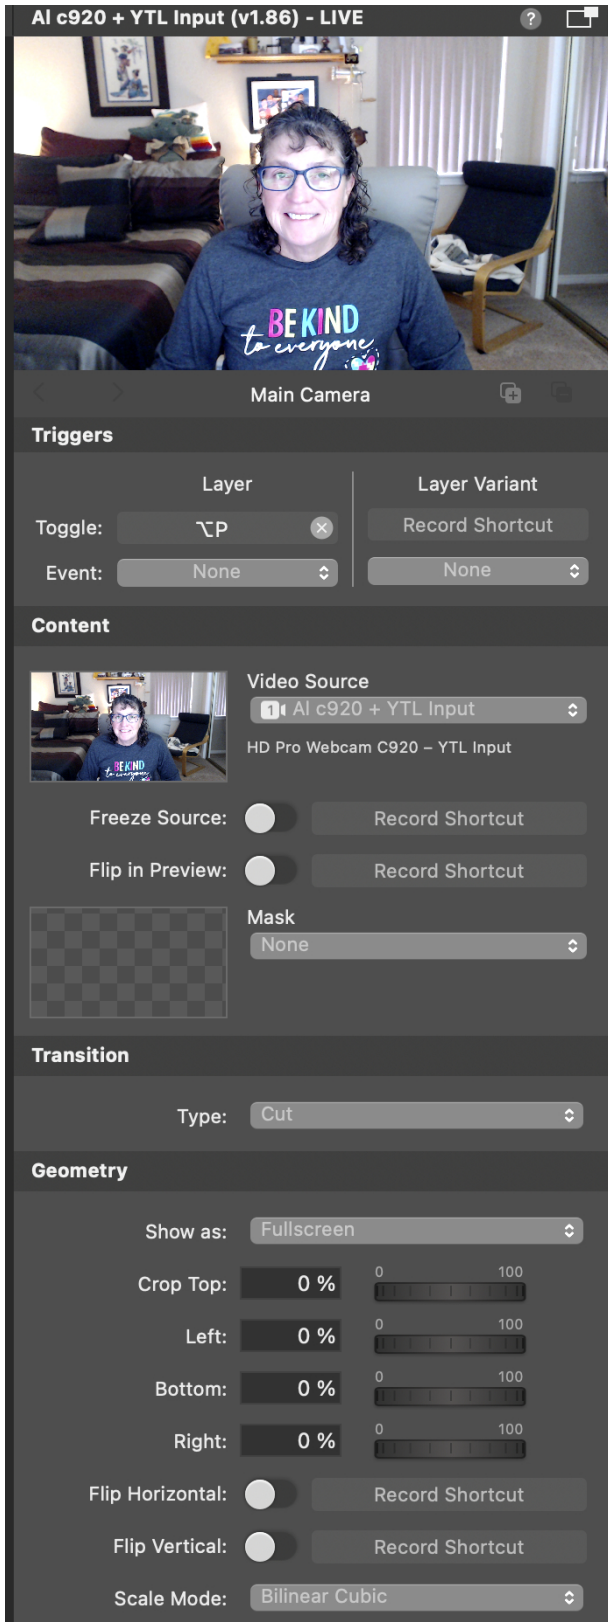

## 7. Layer Stack

1. Steve Audio - If selected shows Steve's waveform
2. AI's audio & video - if selected shows AI's camera and audio

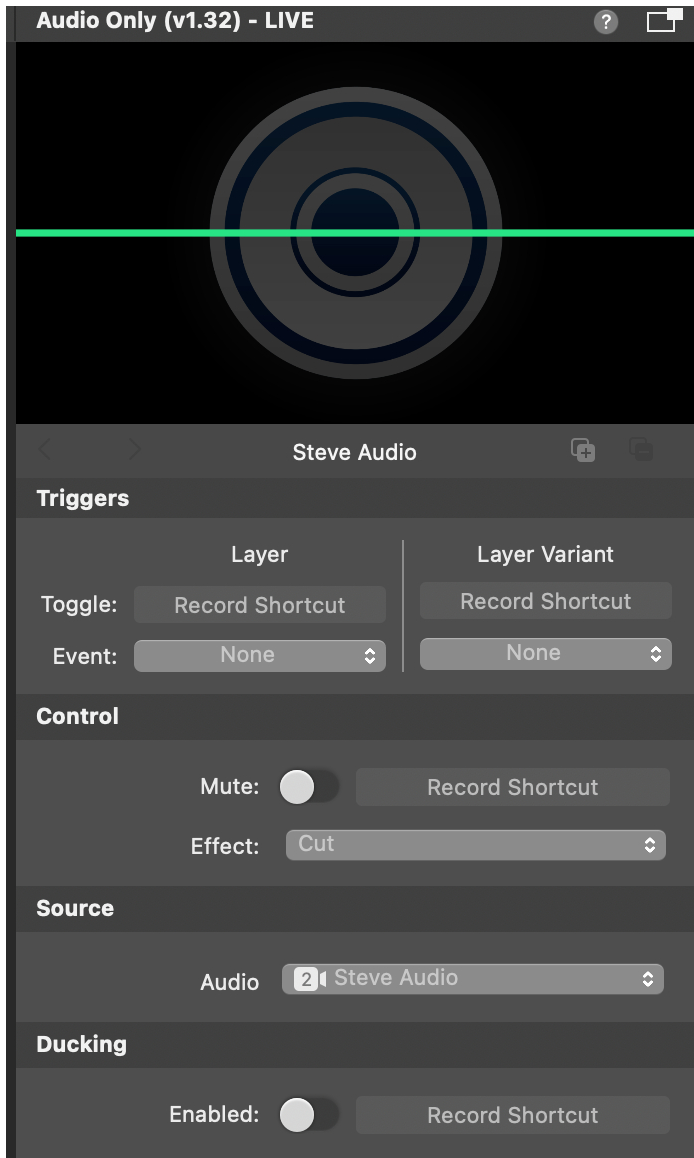

## 7.1 Layer Stack – AI audio & video

## 7.2 Layer Stack - Steve Audio

Again this would show a waveform if Steve was broadcasting to AI

## 8. Program Output - NOT Live (Green Buttons)

NDI Hindy

- Video set to Hindy → Desktop Capture source we created

NDI AI c920

- Video set to Program Output Audio set to Audio Mix 1 (?)

Failsafe Source: None 3

Connections: 0  
On Program: No  
On Preview: No

Encoder Status: Normal.

Encoder Rate: 30.0 FPS  
Dropped: 3 Frames

## 9. Configure the Show

1. Set size to 1080p 16:9
  - a. This lets Steve go full screen on anything I send him, my video OR Hindenburg
  - b. Note Hindy isn't that big, but will scale up just fine
2. Video frame rate has to be at 30fps or I get the **dreaded red output destination problem on Hindy**

Show Length: 12:00:00 AM Counts up  
 Start Offset: 12:00:00 AM  
 End Offset: 12:00:00 AM ?  
 Size: 1,920 x 1,080 16:9 **1**  
 Video Frame Rate: 30 **2**  
 Audio Sample Rate: 48,000
